AKG Quick Start Guide Version 2024-02-12.1

AKG Android Alert and Notification Guide

This guide is for Android users only. iPhone users do not need special settings to ensure AKG alerts are consistently delivered. Android devices, by default, will put applications which are not frequently used into a deep sleep mode. If you do not regularly open the AKG app, alerts and notifications will not be shown. Your monitored equipment is important, and failure to receive timely alerts and notifications could cause trouble. After installing the AKG app, please follow this guide to ensure you will receive alerts should your monitored equipment or appliance misbehave.

Open Settings

Search for "deep" then press Deep sleeping apps

Press the + in the upper right corner

Find and check the AKG app

Ensure the AKG APP is in the Never sleeping apps screen

Please note that your Android device or Android OS version may be different and these instructions may not work on your particular device. Searching the web for "disable deep sleep" for your device type will likely yield good instructions for how to ensure you receive alerts and disable deep sleep for the AKG app. If all else fails, please email support@vigilantonsite.com with your device type and Android version and we will do our best to assist.
